

Developing an OpenChain Review Process

Who is it for?

Any company that develops software to sell onto a customer base—big or small.

Why do you need it?

As part of the software supply chain, your customers will look to verify your quality of work as a vendor, whilst you in turn will be sourcing legitimate devices and contractors – each having a knock-on effect.

Having an OpenChain review process will help you to better assure the excellence of the software supply chain to your customer:

- Illustrates best practise and gives formal recognition that policies are in place to minimise risk
- Demonstrates that you understand the steps required to increase the quality in the software supply chain – both as a supplier and a customer
- Gives you the tools to understand new approaches to reducing risk in software development

What do you get?

The aim of OpenChain is to create a software supply chain whereby open source software is delivered with credible compliance information.

On our ½ day OpenChain Review Process course you'll leave with the knowledge and tools needed to implement your own transparent software supply chain.

- With the help of our consultants, you'll develop a complete OpenChain review process for your company, using OpenChain specification
- You'll gain an understanding of the requirements set out by the specification and how best practise can be achieved
- A Trello board representing your company's current position, with clear actions for further improvement
